# Drivers for 6G and update on Key Value Indicators (KVI)

Stefan Wendt - Orange

# Hexa-X-II Principles and Use Cases

---

# Design 6G to deliver value and to be sustainable

Sustainability is the key value and driver in Hexa-X-II, encompassing the three pillars...

- Environmental sustainability
- Social sustainability ( incl. Trustworthiness and inclusion)
- Economic sustainability

... the duality

- **Sustainable 6G**: 6G should be inherently designed to meet sustainability commitments (NetZero,...)
- **6G for sustainability**: 6G-based services enabling other sectors/verticals to minimize their impact

... and involve society

- Obtain **feedback on 6G value** addressing their needs and concerns

to define use cases and requirements

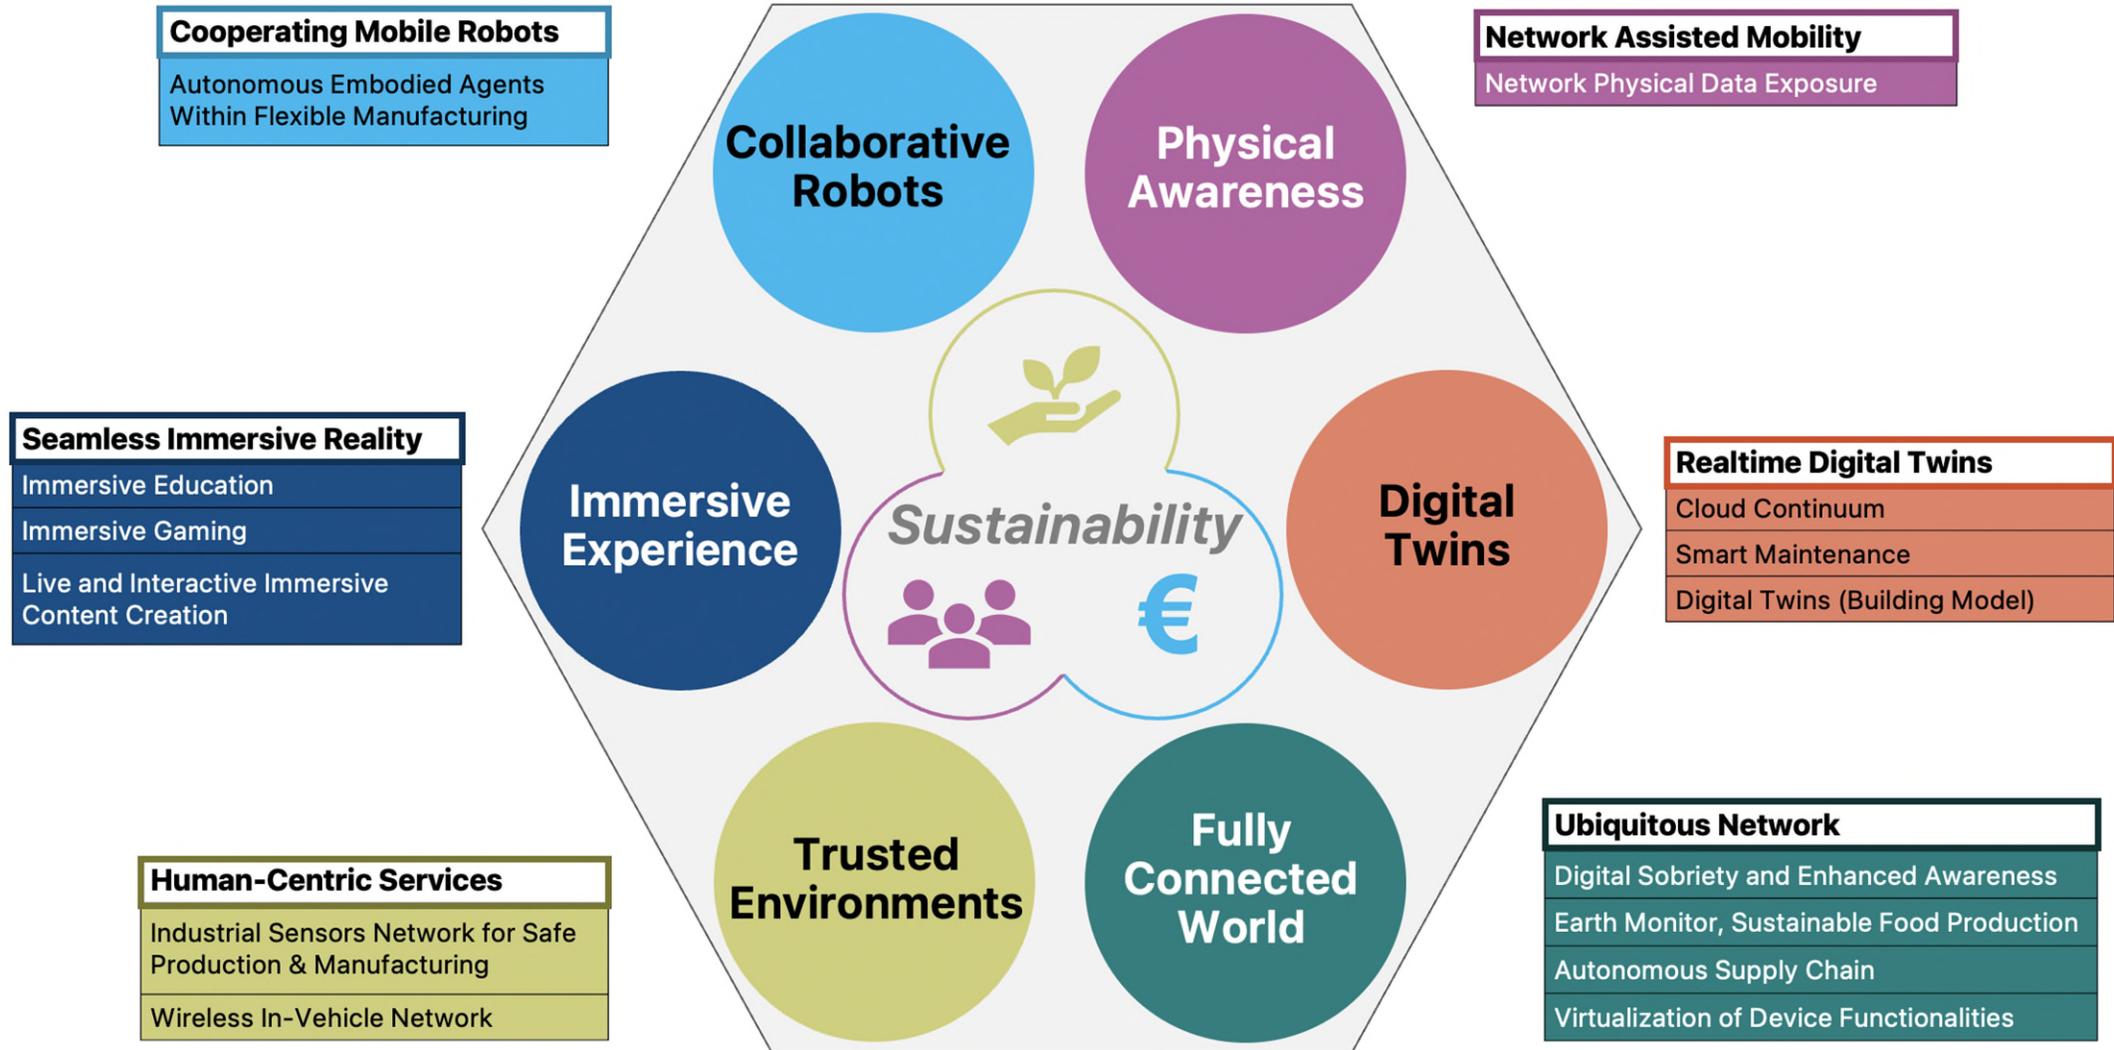

- Extract **requirements, Key Performance Indicators and Key Values and Indicators**

and analyse stakeholders & ecosystem models

- Identify key **stakeholders** and define **business and revenue models** and establish the **6G ecosystem**

# Goals, Key Values & Key Value Indicators

---

Overview

# A new starting point introduced

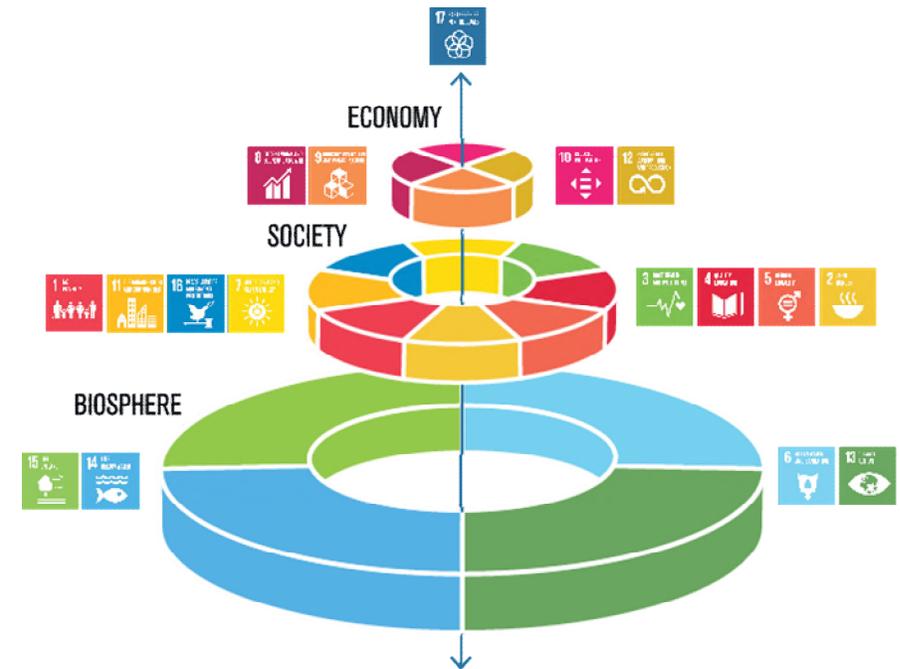

## High Level Human and Planetary Goals

- New technology should support a more sustainable future
- A common set of goals was introduced, **The Human and Planetary Goals**
  - Derived from sustainability focus areas formulated in previous deliverables in Hexa-X-II - D1.1 and D1.2
  - Thoroughly discussed and formulated in the assigned working group
  - Linked to the United Nations Sustainable Development Goals

### SUSTAINABLE DEVELOPMENT GOALS

# Overall Principle

## Definitions

High-level Human & Planetary Goals

High-level human values as goals, like the UN SDGs or their subsets.

Key Values

Key values represent the impact of the use case & technology on the high-level human and planetary goals.

- Positive impact of use case & technology use needs to be maximized, and negative impacts need to be minimized.
- Key Values have to be identified in the three sustainability domains.

Key Value Indicator

A KVI is a qualitative or quantitative indicator for assessing a KV. The purpose of KVI is to gauge the impact from the execution of a use case in terms of economic, social and environmental outcomes. A certain target should be set for each KVI. Two type of KVI exist:

- **Use Case KVI:** a quantitative or qualitative indicator used to assess an impact of a use case (application)
- **Enabler KVI:** a quantitative or qualitative indicator to assess the impact of the technical <sup>11</sup> enabler, i.e. the technology applied to a Use Case.

Use Cases

Hexa-X-II Use Cases with **Highlighted** Representative Use Cases

# Cooperating Mobile Robots

## Cooperating mobile robots

Robots communicate locally to perform tasks beyond their individual capabilities. E.g., flexible manufacturing, autonomous construction site

## Autonomous embodied agents

AI/ML and integrated sensing enable tools/machines to make decisions.

### Example Scenarios

- Cooperative carrying with robots
- Lot size 1 production
- Automated industrial tasks (e.g., quality checks)
- Autonomous farming
- Autonomous construction site
- Smart workshop

### Problem(s) to be Solved/Challenges

- Understanding and addressing the communication requirements of machines in the future
- Using limited resources efficiently
- Adapting to dynamic requirements of the market
- End-user access to custom manufacturing
- Safe and trustworthy interactions with tools that can make decisions

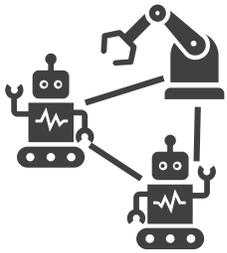

### Why 6G?

- 5G URLLC does not meet the latency, reliability, and scalability requirements in demanding scenarios.
- Benefit greatly from advances in ML, and network-side support (e.g., training, offloading, edge computing)
- Sensing and positioning capabilities to enrich advanced ML applications

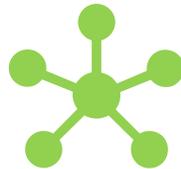

# Cooperating Mobile Robots

## Functional Requirements

Local Connectivity

Dynamic topologies

E2E Latency

Positioning

Sensing

AI/ML

## KPIs

Data rates  
[Mb/s]

< 10

Data rate between robots and campus network, depends on level of autonomy of robots  
Can be significantly higher locally in a subnetwork (raw sensor data, ML-related traffic)

Area density  
[Mb/s/m<sup>2</sup>]

< 0.1

World's largest industrial manufacturing campuses accommodate thousands of robots.  
1 m<sup>2</sup> per robot, 10% of the overall area occupied

Mobility

< 20

Slow vehicular

E2E Latency  
[ms]

< 0.8

200 coordination messages per second, x3 for redundancy  
Transfer interval of 1.67 ms  
x0.5 to ensure enough margin for error recovery [22.104]

Reliability  
[%]

99.999 –  
99.99999

Application-side mechanism compensate occasional packet losses and delays at link level ("survival time")  
Selected applications may have an even more strict reliability requirement up to 99.999999% [22.104].

# Cooperating Mobile Robots - Key Value Indicators (Environment)

non-exhaustive list

## Key Values Indicators

		Key Value	KVI
Environmental Sustainability	Sustainability Handprint	Resource efficiency: Functionalities may be provided by machines with less materials, energy, and waste generated	Overall footprint of the materials involved
			Raw materials_in [Tons]/Material used in products_out [Tons]
			% of produced products remaining in stock/not possible to sell/scrapped
			kWh per process/overall
			# of different dedicated machines in a production plant
	Environmental footprint	Energy is consumed and materials are used to manufacture, deploy, and operate robots and associated services	downtime of robot while switching functionality
			# of functions a robot can undertake
			Energy usage to produce robot's components
			Overall footprint of the materials involved in manufacturing
			Energy usage per robot in operation phase
Sustainability footprint	The manufacturing, including material extraction and industrial processes, and transportation of robots generate GHG emissions	Energy usage for data transfer (optimising packets and amount of data)	
		Total footprint of production & transportation processes	
		% share of recycled materials used	
	The disposal of machines and devices results in increased electronic waste	% material reduction (kg or GHG)	
		life expectancy of robots	
		% of recyclability of robots	
		% of reused materials used	
# of virtualised functionalities			

Collaborative Robots

### Definition

**A Key Value Indicator (KVI) is a qualitative or quantitative indicator for assessing a Key Value.**

Two type of KVI exist:

- **Use Case KVI:** a quantitative or qualitative indicator used to assess **an impact of a use case** (application)
- **Enabler KVI:** a quantitative or qualitative indicator to assess **the impact of the technical enabler, i.e. the technology** applied to a Use Case.

# Cooperating Mobile Robots - Goals and Outcomes
